

POWER TORQUE TAKES JCB ENGINES OFFSHORE WITH PYROBAN®

25 of the latest JCB diesel engines have been ordered by a global well service company for use on oil and gas installations throughout the world. Specialist engine supplier Power Torque Engineering Ltd, working with Pyroban® (www.pyroban.com) provided the complete Zone 2 engine solutions.

“A single order of 25 Zone 2 engines is unusual” Explains David Tinsley, Manager of UK based specialist engine supplier Power Torque. The company works closely with explosion protection safety company Pyroban to ensure that its engines comply with ATEX for use in Zone 2 hazardous areas offshore.

Power Torque are distributors for a number of engine manufacturers including JCB, a brand well known in the earth moving market that in 2003 entered the industrial power system sector. The 25 JCB units are Naturally Aspirated 63 Kw (84 Hp) engines providing increased power at lower speeds. All are fitted with full Zone 2 Pyroban explosion protection for operation as DHU's (Diesel Hydraulic Units) on various offshore installations all over the world.

Tinsley continues “The Pyroban system allows the engines to reach optimum performance whilst removing any potential sources of ignition such as high surface temperatures or engine over-speed for full ATEX compliance.”

Power Torque provides full backup with service and component parts to ensure the engines are fully supported in operation. “We have extensive experience in the oil and gas market and ensure that customer requirements are met from the initial engine specification stage, right through to service support. .”
